# Part 1: Updated Product Scope

### Finalized Startup Idea:

Our startup is called Undone. It is a web application that helps subscription businesses understand why their customers are canceling. Businesses can upload customer cancellation feedback and use the application to find common reasons people are leaving. The goal is to help businesses understand what they need to improve so they can keep more customers.

### Problem Being Solved:

Subscription businesses can lose customers for different reasons but it can be hard to figure out which problems are happening the most. Customer feedback is not always organized and reading through every response takes time. Undone helps solve this problem because it organizes the feedback into themes and makes it easier for businesses to see why customers are canceling.

### Target Users:

Our target users are subscription-based businesses that collect feedback from customers who cancel their subscriptions. Smaller businesses could especially benefit from Undone because they may not have the time or resources to manually review large amounts of feedback. The application would help business owners understand customer complaints and make better decisions.

### Three Core Features:

Our first feature is CSV uploading. Users can upload a file containing customer cancellation feedback and the application will store the responses. This makes it easier to work with feedback that a business has already collected.

Our second feature is AI theme detection. The AI will analyze the customer responses and group them based on the reason for cancellation. This feature is important because businesses would not have to manually categorize every response. The AI feature is still being developed.

Our third feature is the dashboard. The dashboard shows the most common cancellation reasons and how cancellations change over time. Users can also compare feedback across different subscription plans. This helps businesses see patterns in their customer feedback.

## User Experience:

Undone is designed to be simple to use because businesses should not have to spend a lot of time organizing customer feedback. The user starts by creating an account and logging in. They can then upload a CSV file containing customer cancellation responses. The application stores the feedback in the database and allows users to review their responses. Once the AI feature is implemented it will automatically assign themes to the responses based on why customers canceled. Users will also be able to manually change themes if the AI makes a mistake. The dashboard will then show the most common cancellation reasons so businesses can understand what problems they need to focus on. This gives users a complete process from uploading feedback to understanding why customers are leaving.

## Product Differentiation:

Undone is different from a basic survey tool because it focuses on analyzing cancellation feedback instead of just collecting it. Businesses can upload feedback they already have and see which problems are happening the most. The AI theme detection will make the application more useful because it can reduce the amount of manual work needed to organize responses.

## Changes From P2-A2:

Our main startup idea has stayed the same. We are still focusing on helping subscription businesses understand customer cancellations through feedback analysis. We have started building the application in Django with features for uploading CSV files and viewing customer feedback through a dashboard. We are also working on AI theme detection so the application can automatically categorize cancellation responses.
